

Real world analytics – Practical 01

Q1. Import the pandas library and give it a short name `pd`.

Q2. Create a dataset (dictionary) with the following columns:

- Hours_Studied
- Attendance
- Assignment_Score
- Sleep_Hours
- Final_Grade

Q3. Convert this dictionary into a pandas DataFrame and save it as `df`.

Q4. Print the first 5 rows of the DataFrame.

	Hours_Studied	Attendance	Assignment_Score	Sleep_Hours	Final_Grade
0	4.0	80	75	6.0	B
1	6.0	90	85	7.0	A
2	5.0	85	78	5.0	B
3	7.0	95	92	NaN	A
4	3.0	70	65	4.0	C

Q5. Print the names of all columns.

Q6. Print the data types of each column.

Q7. Check how many missing values are in each column.

Q8. Print only the Hours_Studied column.

Q9. Find the average of the Attendance column.

Q10. Print all the unique values in the Final_Grade column.

Q11. Fill missing values in the Sleep_Hours column with the average (mean) value.

Q12. From the dataset, which 3 features do you think are most important for predicting Final_Grade? (Write your answer in a Markdown cell).
